## 1. Objective

The purpose of this lab is to introduce students to Microsoft SQL server environment and getting started with Data definition queries and Data modification queries.

## 2. Prerequisites

You should know the concepts of Primary key, foreign key and how to identify these constraints from the given schema. You have to read the manual before coming to lab.

## 3. Task Distribution

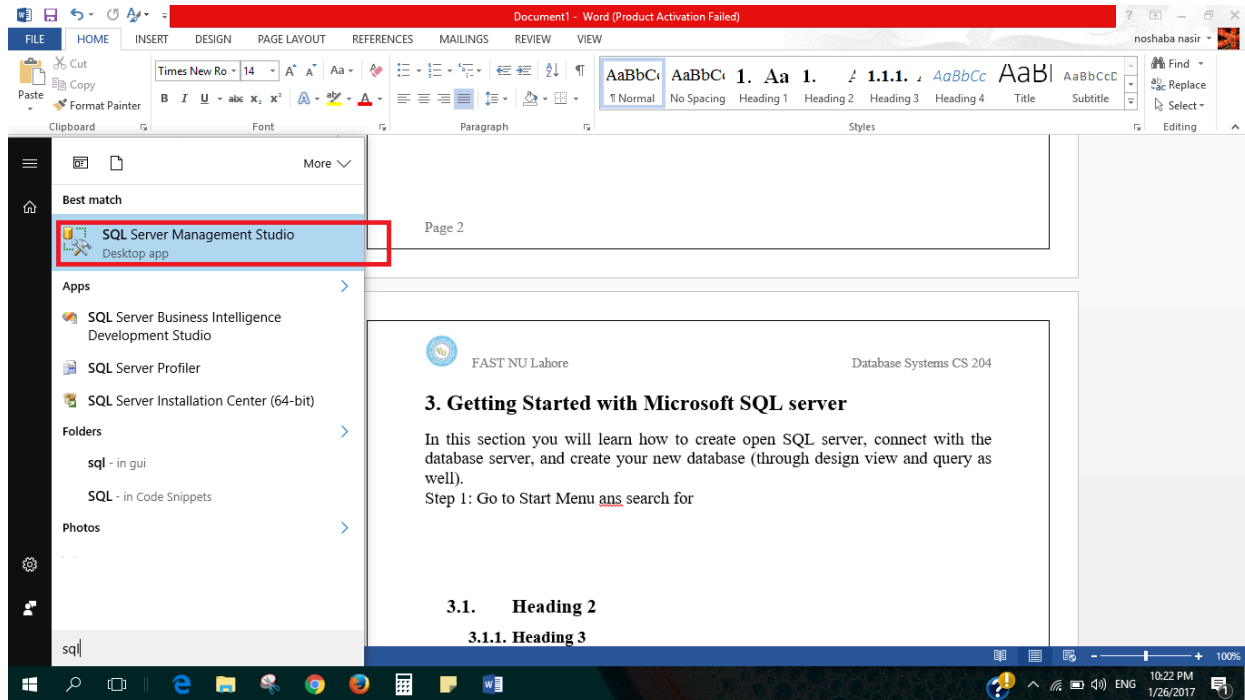

Total Time	170 Minutes
Introduction to MSSQL	20 Minutes
DDL	30 Minutes
DML	30 Minutes
Exercise	60 Minutes
Evaluation	20 Min

## 4. Getting Started with Microsoft SQL server

In this section you will learn how to create open SQL server, connect with the database server, and create your new database (through design view and query as well).

### Step 1: Open SQL server management Studio

Go to Start Menu and search for SQL Server Management Studio, open it

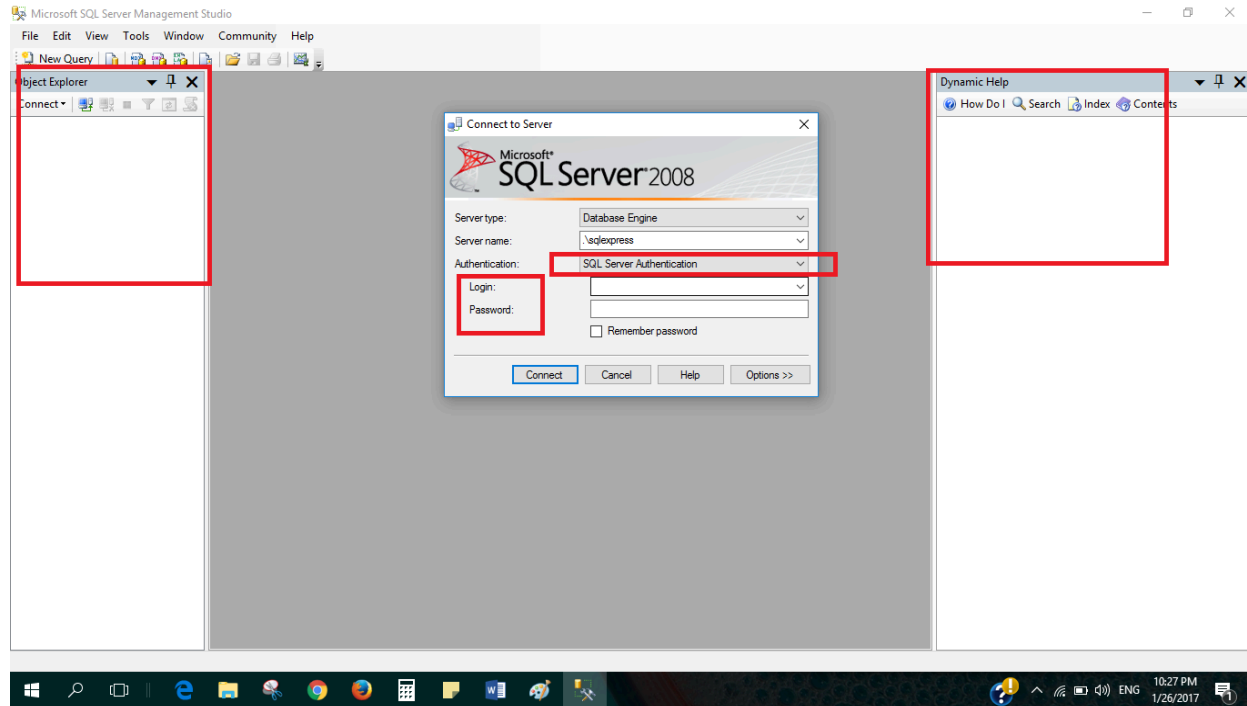

### Step 2: Connect to Server

On the left side you have Object Explorer which you will use to explore all your databases and any object you create such as tables, on the right there is Dynamic Help.

In the middle you can see the Connect to server dialogue box.

Select SQL Server Authentication from the Authentication Drop-down.

Ask for login and password from your lab instructor and press Connect (refer to the following figure)

### Step 3: Create your own Database

There are two ways to create a new data base

- Through Query

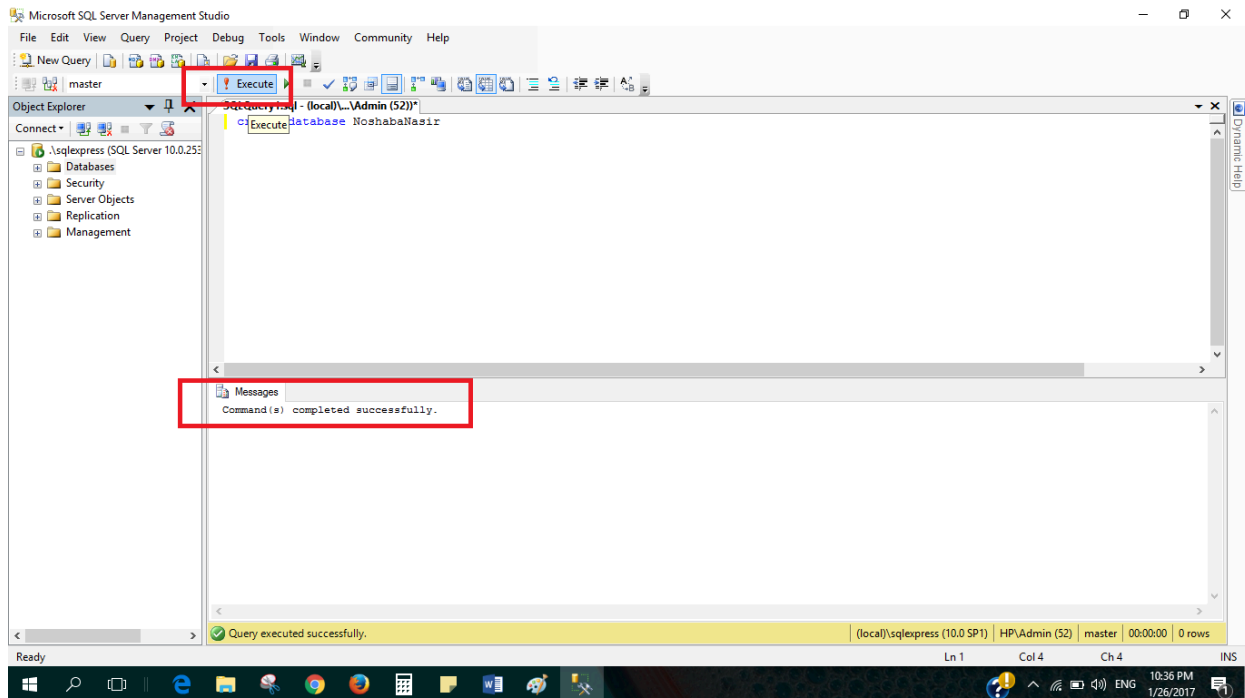

>>Click on New Query, a new blank page will open (as shown in following figure)

>>Write the following query on this page

`create database <nameofyouDatabase>`

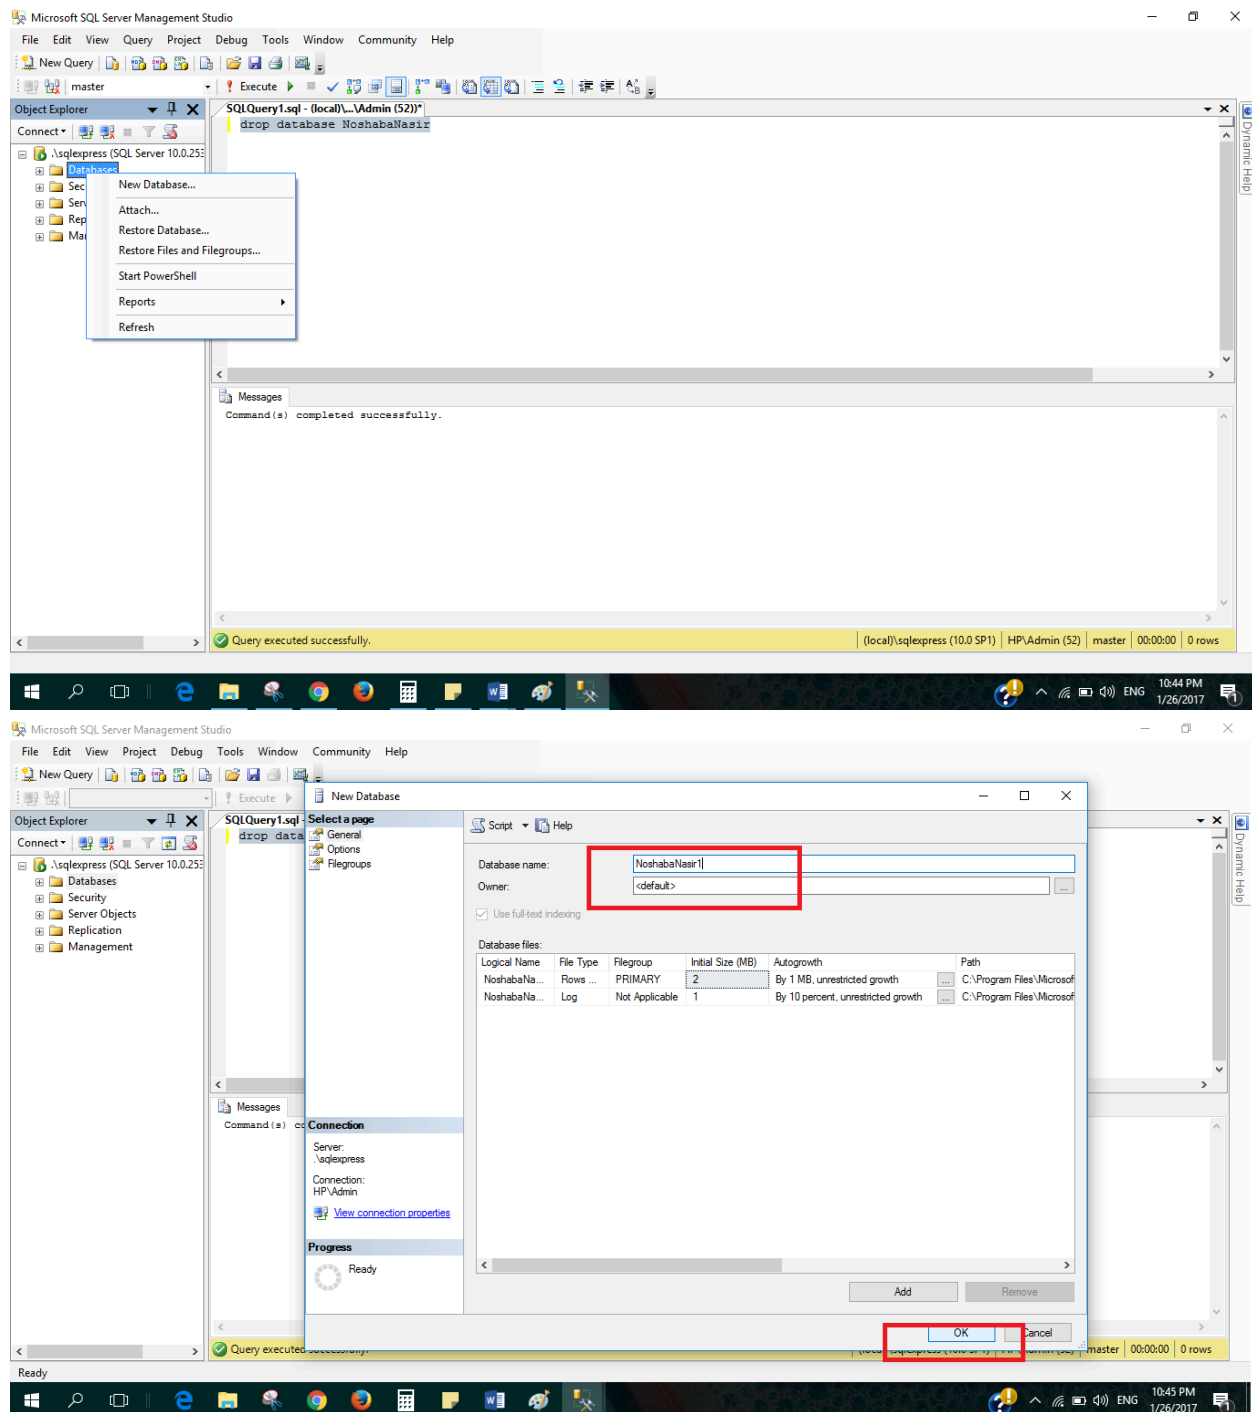

>>Hit Execute button shown on top, Command completed successfully shows that you database has been created. (As shown in following figure)

**>>If you want to delete your database write the following query and Execute, make sure that the command is executed successfully.**

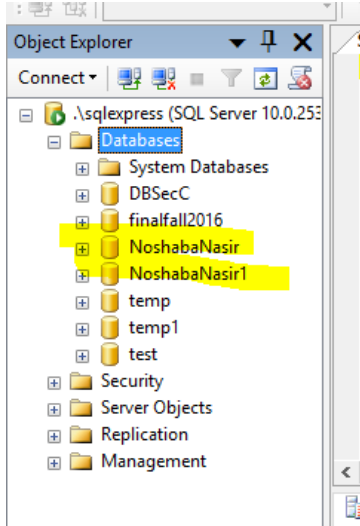

```
drop database <DatabaseName>
```

You can also create new database by Left click on Database from object Explorer and select new Database, give it a name and press ok (as shown in following figures).

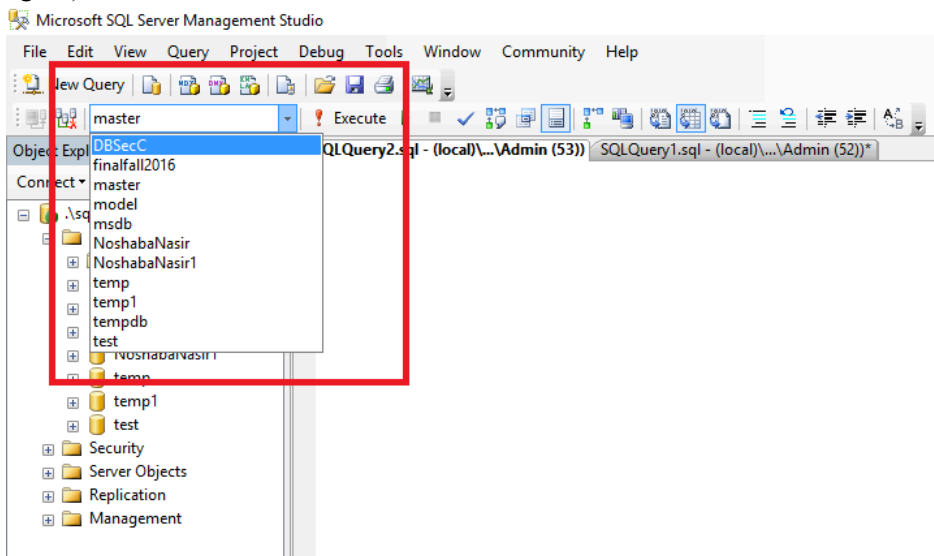

## Step 4: View and use you database

If you expand the Database from object explorer, you can see all of the databases that exist of the server, including the newly created ones (as shown in following figure).

To use your database, make sure to select your database from drop down menu (as shown in following figure).

Or you can use the following query to use your database.

Use <databaseName>

## 5. Data Definition Language:

Also called DDL includes creating objects such as tables, adding constraints of tables, such as FK PK unique constraints, in this section you will learn how to create tables and add PK, FK constraints using Queries.

## Step 1: Create table:

Following is the syntax of table creating query

```
create table [tablename]
(
[Column1Name] datatype null/Not null,
[Column2Name] datatype null/not null,
[Column2Name] datatype null/not null
)
*null is default
```

Create the table Students using the query as shown in following figure, Execute, make sure the message shows that the command is successful.  
Go to object explorer and find you table.

## Step 2: Altering table Schema

### Adding new column to existing table

```
alter table <TableName> add <NewColumn> <Datatype>
```

Try this query

```
alter table Students add Address varchar(50)
```

### Drop existing Column from existing table

```
alter table <TableName> drop column <ColumnName>
```

Try this query

```
alter table Students drop column [Address]
```

### Step 3: Add Primary key Constraint.

One way to create Primary key is to add it whilst creating table using the following syntax

```
create table [tablename]
(
[Column1Name] datatype primary key,
[Column2Name] datatype,
[Column2Name] datatype
)
OR if there is composite key
create table [tablename]
(
[Column1Name] datatype,
[Column2Name] datatype,
[Column2Name] datatype,
Primary key ([Column1Name], [Column2Name])
)
```

Try the following query, see in object explorer

Primary key should be not null

Try the following query, see in object explorer

Other way is to add Primary key constraint after creating the table, by using ALTER query,

```
alter table [tableName] add constraint [keyConstraintName] Primary key (Column1,
column2, column3)
```

Try the following, PK columns should be not null

## How to see the schema of your table

Try this to see the schema of your table

```
sp_help <tableName>
```

This will give you information about columns, their datatype and all the constraints on the table.

## Step 4: Add foreign key constraint to tables

Before creating FK constraint Make sure that the referred table and its referred columns are created.

**Add FK whilst creating table.**

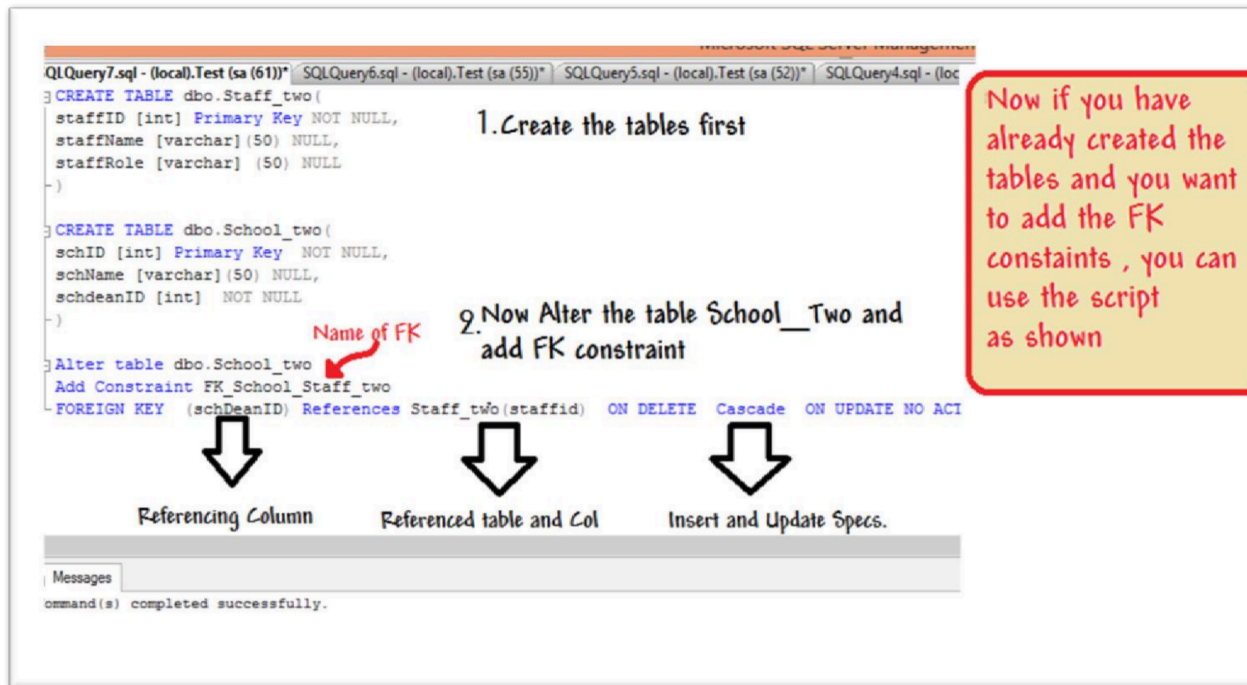

Use the following syntax as given.

```
create table [tablename]
(
  [Column1Name] datatype Null/Not Null,
  [Column2Name] datatype Null/Not Null,
  [ReferencingColumn] datatype Null/Not Null
  FOREIGN KEY REFERENCES referredtable(referedColum)
  ON DELETE NO ACTION/CASCADE/SET NULL/SET DEFAULT
  ON UPDATE NO ACTION/CASCADE/SET NULL/SET DEFAULT
)
*no action is default
```

Try the following, and see in object explorer.

**FK can also be added after the referencing and referred tables have been created.**

Try the following and see in object explorer

**1. Create the tables first**

```
CREATE TABLE dbo.Staff_two(
    staffID [int] Primary Key NOT NULL,
    staffName [varchar] (50) NULL,
    staffRole [varchar] (50) NULL
)

CREATE TABLE dbo.School_two(
    schID [int] Primary Key NOT NULL,
    schName [varchar] (50) NULL,
    schDeanID [int] NOT NULL
)
```

**2. Now Alter the table School\_Two and add FK constraint**

*Name of FK*

```
Alter table dbo.School_two
Add Constraint FK_School_Staff_two
FOREIGN KEY (schDeanID) References Staff_two(staffid) ON DELETE Cascade ON UPDATE NO ACTION
```

**Referencing Column**      **Referenced table and Col**      **Insert and Update Specs.**

Messages  
command(s) completed successfully.

Now if you have already created the tables and you want to add the FK constraints, you can use the script as shown

## 6. Data Modification Language

### Step 1: Insert rows into table

Syntax

-- let there be N columns in a table

```
INSERT INTO <tableName>
```

```
values
```

```
(Column1Value,Column2Value, Column3Value,...,ColumnNValue), --row 1
```

```
(Column1Value,Column2Value, Column3Value,...,ColumnNValue), --row2
```

```
(Column1Value,Column2Value, Column3Value,...,ColumnNValue) -row 3
```

Or

```
INSERT INTO <tableName> (ColumnX,ColumnY) -- List of Columns
```

```
values
```

```
(ColumnXValue,ColumnYValue), --Row 1 list of Correspong column values
```

```
(ColumnXValue,ColumnYValue), --Row 2
```

```
(ColumnXValue,ColumnYValue) -Row 3
```

Try the following

```
INSERT INTO [Students1] ([RollNo],[Name],[Age],[GPA],[DOB])
```

```
VALUES (13, 'Ahmed', '20', 2.4, '1/1/1990')
```

```
GO
```

Try the following

```
INSERT INTO [Students1] ([RollNo], [Name], [GPA])  
VALUES      (13, 'Ahmed', 2.4)  
GO
```

## Step 2: To see the data from you table use the following table

```
Select * from tableName
```

Try the following and see the results

```
Select * from Students1
```

Results				
RollNo	Name	Age	GPA	DOB
13	Ahmed	20	2.4	1990-01-01 00:00:00.000
13	Ahmed	NULL	2.4	NULL

## Step 3: Delete rows from the table

```
Delete from <tableName>
```

```
Where <conditions>
```

Try the following and see the message and data in table using select query

```
Delete from Students1
```

```
Where Age=20
```

Messages	
row(s) affected)	

## Step 4: Delete all the data from the table

```
Delete from <tableName> --as there is no where condition all rows will be deleted
```

Or

```
Truncate table <tableName>
```

Try these two commands after adding some rows to the table and see the results.

## Step 5: Updating the rows

```
Update tableName
```

```
set ColumnA=<NewValue>,
```

```
ColumnB=<NewValue>,
```

```
where <Conditions>
```

See the data in table before and after trying the following query

```
Update Students1
```

```
set Name='Ali Ahmed'
```

```
where Name='Ahmed'
```

## Appendix

### Comments in SQL

Comments in SQL server start with two dashes as shown below, in green color

```
--This query create student table  
CREATE TABLE students  
(  
  id INT,  
  fullName varchar(40)|  
)
```

### Data Types

#### Exact Numerics

<a href="#">bigint</a>	<a href="#">numeric</a>
<a href="#">bit</a>	<a href="#">smallint</a>
<a href="#">decimal</a>	<a href="#">smallmoney</a>
<a href="#">int</a>	<a href="#">tinyint</a>
<a href="#">money</a>	

#### Approximate Numerics

<a href="#">float</a>	<a href="#">real</a>
-----------------------	----------------------

#### Date and Time

<a href="#">date</a>	<a href="#">datetimeoffset</a>
<a href="#">datetime2</a>	<a href="#">smalldatetime</a>
<a href="#">datetime</a>	<a href="#">time</a>

#### Character Strings

<a href="#">char</a>	<a href="#">varchar</a>
<a href="#">text</a>	

## Unicode Character Strings

<a href="#">nchar</a>	<a href="#">nvarchar</a>
<a href="#">ntext</a>	

## Binary Strings

<a href="#">binary</a>	<a href="#">varbinary</a>
<a href="#">image</a>	

## Where Conditions

Or  
And  
Not  
In

### Sub queries

In  
All  
Any  
Some  
Exists

### How to see all the tables in your database:

```
SELECT * FROM INFORMATION_SCHEMA.TABLES;
```

Or

```
select * from sys.tables;
```

or

```
SELECT * FROM sysobjects WHERE xtype='U';
```

### How to see details of certain table

```
sp_help tableName
```
